Ultrahigh Brightness
High Readability

Full-Color / 256-Color /
Tri-Color / Monochrome

Remote Control
and Monitoring

Message Scheduling

User-Friendly
Software Interface

Operation Activity Log

Instant Alert Message
Broadcasting

Act One Communications introduces the advanced LED Variable Message Signs (VMS), which are used to deliver real-time traffic information. Our VMS products range from simple monochrome message signs to full-matrix signs capable of displaying graphics in full colors.

From the information displayed on VMS, the motorists can realize the current traffic conditions on freeways, tunnels, or bridges. VMS also provides timely warning of unusual traffic congestion, traffic crashes, road works or other hazards that can affect transiting time.

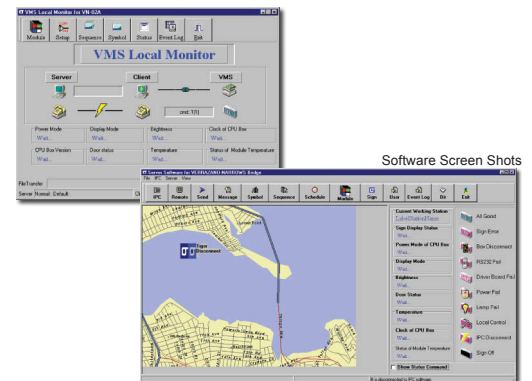

Graphic displays are intuitive and easy to understand. The color VMS products allow you to compose your message without limitation. Thanks to our advanced LED technology, the LED VMS literally glows, even in direct sunlight. The LED component is rated at 100,000 hours lifetime expectancy, and therefore the LED VMS requires minimal maintenance.

The server/client based software is easy to use, and capable of networking multiple VMS to allow centralized management and monitoring. Messages and graphics can be

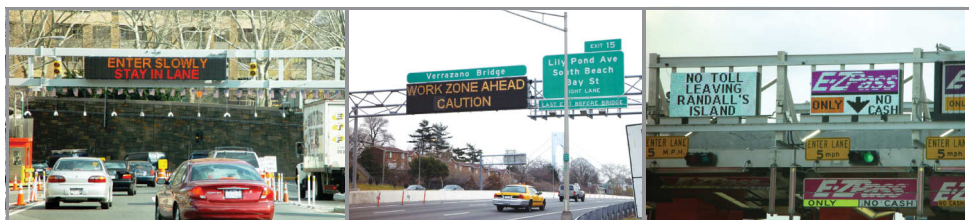

edited and stored with the built-in library function. Message can be grouped as a sequence, and multiple sequences can be scheduled to display on specific time frames depending on the local traffic conditions.

The system status is continuously monitored from the control center when networked. Users may be programmed to have different access authorities with password control. All operational activities, system warnings and errors are recorded in the log file for reference.

Welcome to the next generation of VMS experience - The Act One LED Variable Message Signs give you the power to inform and to enhance driver awareness.
